Regi Voda

AI lead across the full stack

0xQwertic@proton.me | Italy, remote (hybrid from Milan) | cal.com/qwertic/20min
qwertic.xyz | github.com/Qwertic | linkedin.com/in/regi-voda

Profile

I know what to build with AI, how, and when not to. I take AI features from first experiment to production, from the database to the model: memory, MCP tools, ingestion pipelines, retrieval, guardrails, evaluation and the interface around them, and I help teams make those calls well. Over three years on a messaging platform at millions of messages a day gave me reliability habits I now apply to non-deterministic systems. I work daily with **Claude Code** and write my own agentic skills.

How I decide

Whether	I start by asking whether it needs a model at all; usually some part of it doesn't. If a rule can be written down, it goes in code.
Model	Guardrails live outside the model: schemas, validation, permissions, refusal paths. Evaluation before scale: real cases with known answers, run on every prompt or model change.
Interface	Show the source, make uncertainty visible, and always leave a way to stop, edit or reach a person.
Tools, data	Small, narrowly scoped MCP tools; idempotent ingestion with provenance on every chunk; hybrid retrieval with access rules at query time; memory with an owner and a review step.

Experience

Full Stack and AI Developer

2024 – Present

Freelance | Remote

- **Dokimazo** (dokimazo.io, client, 2026 – present), a skills-and-credentials platform: shaping the core product and its AI assistant integration, across core features, frontend, backend, internal tools and the assistant's MCP integration
- Contributing to the document extraction pipeline: PDF, DOCX and XML into structured output mapped onto competence frameworks, with human review before anything enters a user's verified record
- Full-stack delivery on an AdonisJS/PostgreSQL API and Next.js frontends in a Bun + Turborepo monorepo: migration, API, UI, i18n (IT/EN) and tests in one ticket, TDD-first
- Led an incremental migration from a legacy Next.js app to a Feature-Sliced Design frontend while the legacy app stayed in production

Software Developer

Nov 2020 – Jan 2024

Callbell | Full remote

- Customer-messaging platform at millions of messages a day and around 2,000 monthly active business accounts; full-stack ownership across frontend, backend, mobile, integrations and docs
- Owned the core chat module at that scale, holding a high reliability bar through testing and proactive bug prevention
- Designed and built the CRM from scratch in Ruby on Rails and React, replacing WhatsApp contact lists and third-party CRMs; adopted across multiple teams as their day-to-day working surface
- Co-designed the Rails public API partners integrate against, then became its first consumer by shipping the Zapier and Zoho integrations
- Early LLM features: small AI features around the chat automations
- Rebuilt the frontend and its component library in React and Tailwind CSS as part of a full UI/UX overhaul

Full-stack Developer

May 2019 – May 2020

JustMe Technologies | Paris, France / Hybrid

- Sole developer on the MVP of an EU Horizon-funded venture, owning architecture through release; introduced agile practice to the team
- Delivered the full product; the backers wound the project down before market launch

Ruby Developer

Jan 2019 – May 2019

Freelance | Milan, Italy

- First client projects around the Le Wagon bootcamp

Chef

2011 – 2019

Restaurants, hotels, catering and pubs

- Eight years of high-pressure, service-critical execution before retraining into software

Projects

Cairn

Ongoing

Own project, in progress | github.com/Qwertic/cairn-releases

- Persistent, shared memory for coding agents, served over MCP
- Context engineering, knowledge ingestion into a vector database, and discoverability: agents find what the team already knows
- Data integrity by design: a person reviews what agents write before other agents can recall it

qwertic.xyz

2026

Own site | qwertic.xyz

- "Should this use AI?": a hand-written decision tree that walks a use case to a recommendation, from writing the rule in code to an agent with tools, with the guardrails and evaluation each needs. It uses no model, because it doesn't need one

cursorrules and crrl

Open source | github.com/Qwertic

- Curated rule configs for AI-assisted coding (26 stars, 6 forks) and a CLI to manage them (17 stars, 2 forks)

Skills

Primary	TypeScript/JavaScript, React, Next.js, Node.js/Bun, Ruby on Rails, PostgreSQL, REST and OpenAPI design, Tailwind CSS, TDD
AI / LLM	Agents and assistants in production, MCP tool design, RAG and hybrid retrieval, document ingestion, context engineering, structured output and schema validation, guardrails, evaluation sets, human-in-the-loop review, Vercel AI SDK, OpenAI Agents; agentic coding with Claude Code
Secondary	Python/FastAPI, React Native/Expo, Astro, AdonisJS, Redis, vector stores, Docker, AWS, GitHub Actions, Turborepo
Domain	High-traffic messaging, CRM and sales workflows, public API and integration design, EdTech and credentialing (Open Badges), design systems
Education	Full Stack Coding Bootcamp, Le Wagon, Milan, 2019. MBA online program, ThePower MBA, certificate of completion, 2020
Languages	Italian and Albanian (native, bilingual), Greek (fluent, C1/C2), English (professional working proficiency)
